

Provider

The “Provider” is the most basic of the providers offered by Riverpod

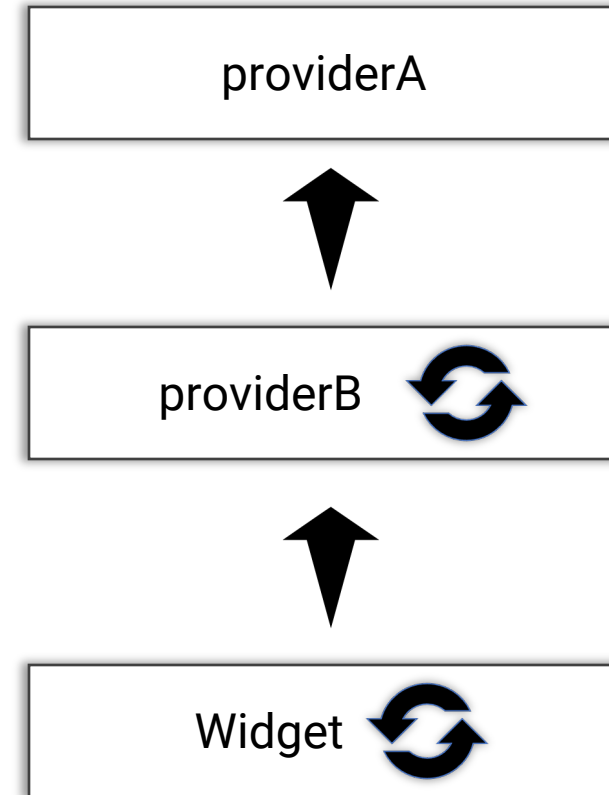

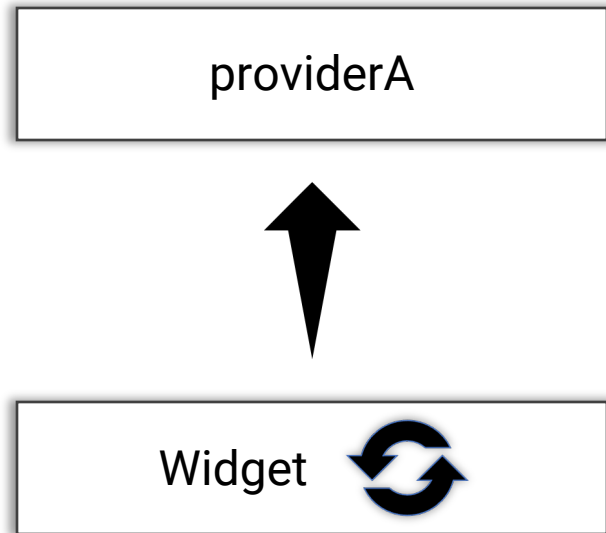

The “Provider” creates value

Its most basic use is to provide a value to a widget or other provider

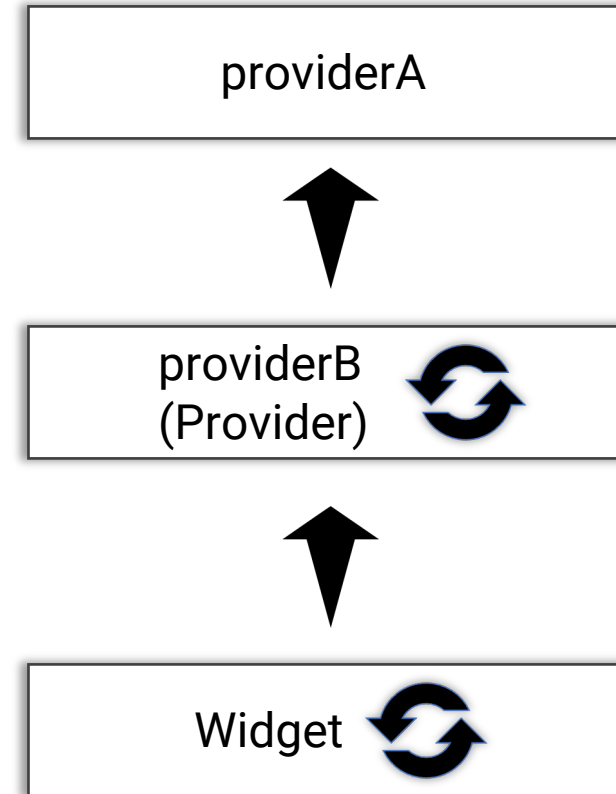

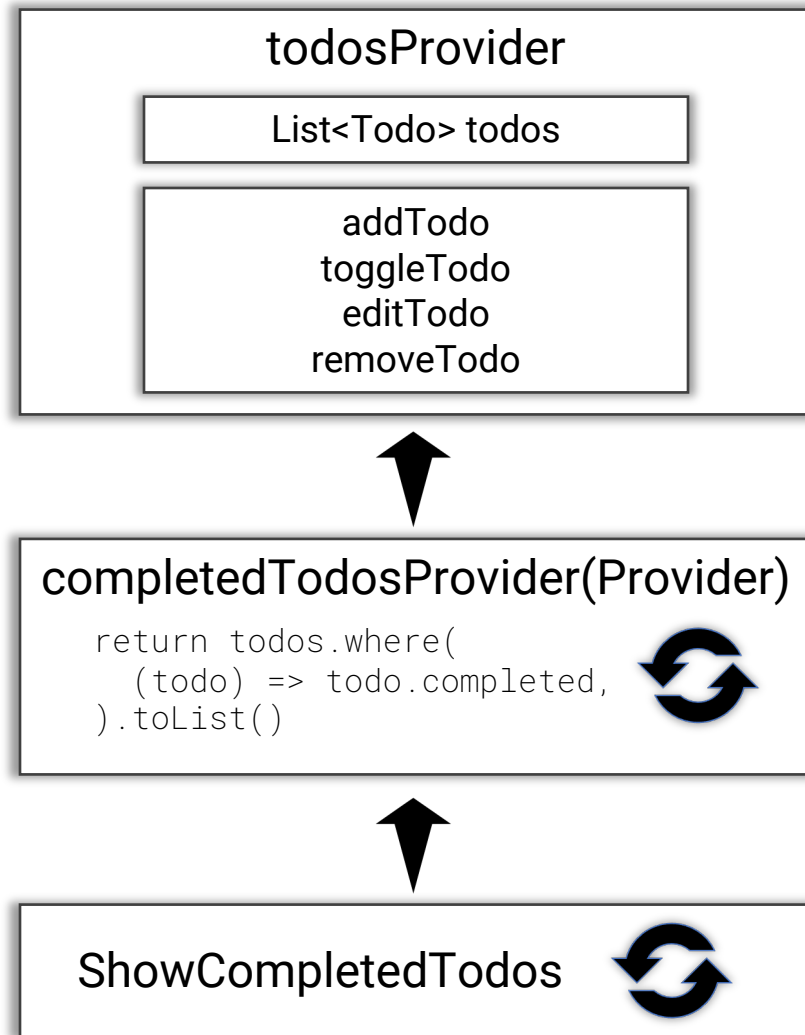

Provider

Provider

Provider for computed state

Provider for value overriding

Development

- FakeRepository

Release

- RealRepository

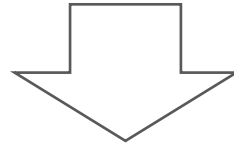

Provide an instance that needs to be initialized asynchronously

- SharedPreferences

Performance optimization

- Minimize rebuilds for ListViews with many elements

- installing packages
- setting up the analysis_options.yaml file
- creating the basic skeleton of the app
